The Deadline is Approaching!

New OSHA Haz Comm Standard - Are you ready?
You may have already heard the buzz words…new haz comm standard, the globally harmonized system, required GHS training, new labels, new pictograms, MSDS’s are no longer called MSDS’s…but what does it all mean?

OSHA’s Hazard Communication Standard (HCS) applies to both general and construction industries. The OSHA HCS regulations have required that employers develop and disseminate information to ensure chemical safety in the workplace. Recent changes to the HCS include new requirements that bring the U.S. standards in line with globally recognized standards for communicating chemical hazards. These recent changes include some deadlines for mandatory employee training, the first of which is December 1st, 2013. With this date looming over employers, many are in need of more information regarding the HCS changes, while others are realizing that this might also be the time to re-examine their company haz comm policies all together.

This half day class produced by the OSHA Training Institute Education Center at Arizona State University is designed to teach employers how to design and implement an effective HCS plan and how develop and deliver effective training for your employees.

HR staff, safety directors and other managers can attend this half day course at ASU, or set aside a full day and attend the HCS training combined with the OSHA Recordkeeping Course to get complete training on implementing these mandatory courses in your workplace.
